## Characterization of Multipath

 Acoustic Channels in Very Shallow Waters for CommunicationsPresented by: Bien Aik Tan Swee Sen Quek Nan Zou
DSO National Laboratories

## CONTENTS

- Introduction
- Objectives
- Hardware Overview
- Channel Measurements

Multipath Profiles
Delay-Doppler Measurements
Signal Envelope Fading Results
Ambient Noise Characteristics

- A note on Link Budgeting
- Conclusion

## INTRODUCTION

Typical COTS modems performed at 200300bps @ BER ~ $10^{-7}$ to $10^{-6}$ for distances up to 2400 m (Actual shallow water performance evaluated by DSO)
July 2004 - assembled a team of acoustics and communication engineers

## OBJECTIVES

- Study of local shallow waters through channel measurements and analysis
- Developed a versatile and reconfigurable underwater acoustic communications test bed
- Investigate and evaluate communications processing techniques
OFDM, DPSK
OTurbo Product Codes

## HARDWARE OVERVIEW

## CHANNEL MEASUREMENTS

AMBIENT NOISE

Noise Level (up to 100 kHz ): 156 dB re $1 \mu \mathrm{~Pa} 1 \mathrm{~m}$ Spectrum Noise Level(up to 100 kHz ): 106 dB re $1 \mu \mathrm{~Pa} 1 \mathrm{~m}$

Noise Level (In Band 10-26kHz): 118dB re $1 \mu \mathrm{~Pa} 1 \mathrm{~m}$ Spectrum Noise Level (in Band 10-26kHz): 76dB re 1 $\mu \mathrm{Pa} 1 \mathrm{~m}$

## LINK BUDGET

Estimated Input Signal to Noise Ratio for a Max 190dB Source Level in approx 156dB Shallow Water Ambient Noise

Oceans Asia Pacific 2006, Singapore

## Conclusion

- Developed a versatile and reconfigurable underwater acoustic communication test bed
- Accumulated at-sea data for communication channel characterizations and communication signals
- Presented delay, Doppler, fading and ambient noise analysis of the channel.
- Observations:
odelay and Doppler effects are less at longer distances
- LOS component is more likely at the longer distances
- Ambient noise is non-Gaussian with a heavy tailed distribution and a highly impulsive behavior
- Communication system designers should take note of the channel characteristics at longer distances ( $>1500 \mathrm{~m}$ up to 4000 m ) to transmit at higher data rates. On the other hand, it would be a serious challenge to design a modem for shorter distances that can achieve the same level of performance that was possible at longer distances
- Change of mindset from "increasing ranges, decreasing bitrate" to "increasing ranges, increasing bitrate". (range $<3 \mathrm{~km}$ )
