under determine

Projects

- **3-4** person groups
- Deliverables: Poster, Report & main code (plus proposal, midterm slide)
- Topics: your own or chose form suggested topics / kaggle
- Week 3 groups due to TA Nima. Rearrangement might be needed.
- May 2 proposal due. TAs and Peter can approve.
- Proposal: One page: Title, A large paragraph, data, weblinks, references.
- Something physical and data oriented.
- May ~16 Midterm slides. Likely presented in 4 subgroups (3TA+Peter).
- 5pm 6 June Jacobs Hall lobby, final poster session. Snacks
- Poster, Report & main code. Report due Saturday 16 June.

Final Report

Poster on June 6 from each group is mandatory. Upload poster as well.

For the Final project (Due Saturday 16 June). Delivery Dropbox request <2GB (details to follow).:

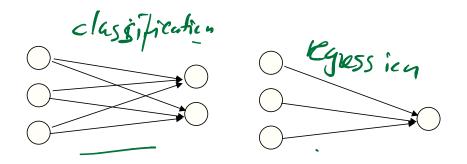

Deliver a code:

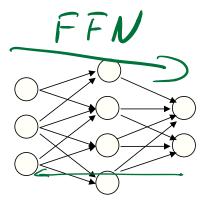

- Assume we have reasonable compilers installed (we use Mac OsX)
- Give instructions if any additional software should be installed.
- You can ask us to download a dataset. Or include it in this submission
- Don't include all developed codes. Just key elements.
- We should not have to reprogram your code.

Report

- The report should include all the following sections: Summary -> Introduction->Physical and Mathematical framework->Results.
- Summary is a combination of an abstract and conclusion.
- Plagiarism is not acceptable! When citing use " " for quotes and citations for relevant papers.
- Don't write anything you don't understand.
- Everyone in the group should understand everything that is written. If we do not understand a section during
 grading we should be able to ask any member of the group to clarify. You can delegate the writing, but not
 the understanding.
- Use citations. Any concepts which are not fully explained should have a citation with an explanation.
- Please be concise. Equations are good. Figures essential. Write as though your report is to be published in a scientific journal.
- Last year's reports are on class website. Especially good projects 2,11,12,13,

Lecture 8: Backpropagation

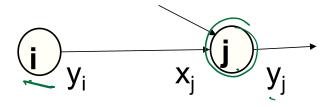

A difference in notation

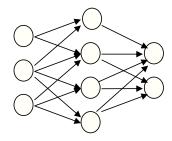

- For networks with multiple hidden layers Bishop uses an explicit extra index to denote the layer.
- The lecture notes use a simpler notation in which the index denotes the layer implicitly.

y is the output of a unit in any layer

x is the **summed** input to a unit in any layer

The index indicates which layer a unit is in.

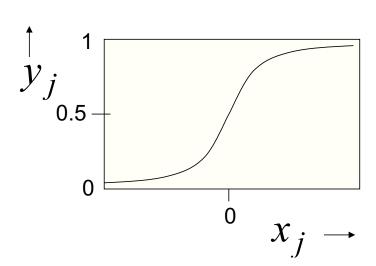

Jeff Hinton

Non-linear neurons with smooth derivatives

- For backpropagation, we need J neurons that have well-behaved derivatives.
 - Typically they use the logistic function
 - The output is a smooth function of inputs and weights.

$$y_j = \frac{1}{1 + e^{-x_j}} \bigcirc$$

 $x_j = b_j + \sum y_i w_{ij}$

$$\frac{dy_j}{dx_j} = y_j (1 - y_j)$$

Backpropagation

- J nodes
- Observations t_i
- Predictions y_i
- Energy function $E = \frac{1}{2} E(g)$

TensorFlow and Matlab training

Choose a Multilayer Neural Network Training Function

R2018a

It is very difficult to know which training algorithm will be the fastest for a given problem. It depends on many factors, including the complexity of the problem, the number of data points in the training set, the number of weights and biases in the network, the error goal, and whether the network is being used for pattern recognition (discriminant analysis) or function approximation (regression). This section compares the various training algorithms. Feedforward networks are trained on six different problems. Three of the problems fall in the pattern recognition category and the three others fall in the function approximation category. Two of the problems are simple "toy" problems, while the other four are "real world" problems. Networks with a variety of different architectures and complexities are used, and the networks are trained to a variety of different accuracy levels.

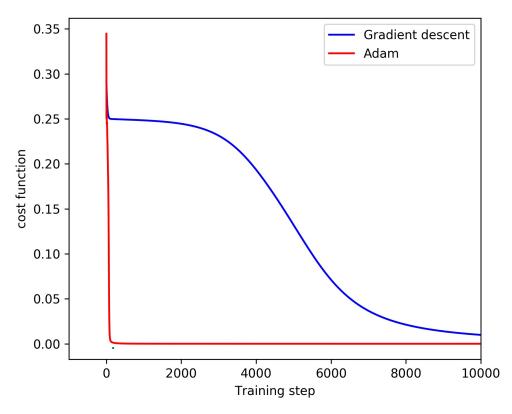

The following table lists the algorithms that are tested and the acronyms used to identify them.

Acronym	Algorithm	Description
LM	trainlm	Levenberg-Marquardt
BFG	trainbfg	BFGS Quasi-Newton
RP	trainrp	Resilient Backpropagation
SCG	trainscg	Scaled Conjugate Gradient
CGB	traincgb	Conjugate Gradient with Powell/Beale Restarts
CGF	traincgf	Fletcher-Powell Conjugate Gradient
CGP	traincgp	Polak-Ribiére Conjugate Gradient
OSS	trainoss	One Step Secant
GDX	traingdx	Variable Learning Rate Backpropagation

The following table lists the six handbook problems and come characteristics of the naturally training processes, and computers used

Gradient results

Maybe from tensorflow with ocean acoustics data

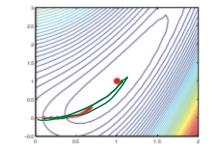

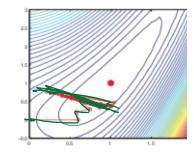

Gradients

$$\boldsymbol{w}_{k+1} = \boldsymbol{w}_k - \eta \nabla E$$

Batch

$$- E(\boldsymbol{w}_k) = \sum_{n=1}^{N} E_n(\boldsymbol{w}_k)$$

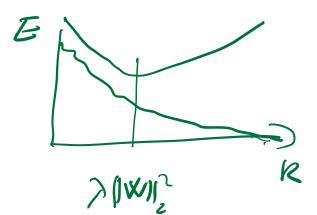

- Stochastic gradient descent:
 - Pick just one data sample n (of N)

$$- \mathbf{w}_{k+1} = \mathbf{w}_k - \eta \nabla E_n(\mathbf{w}_k)$$

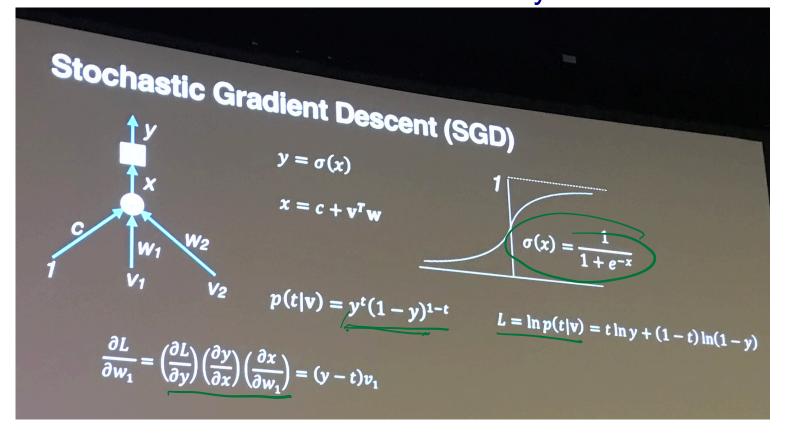

Less sensitive to global minima

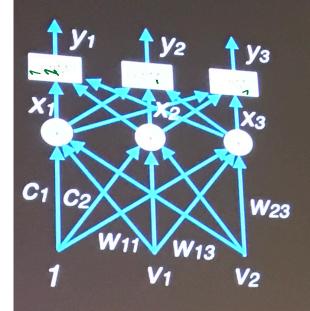

Momentum

$$- \mathbf{w}_{k+1} = \mathbf{w}_k - \eta \nabla E + \mu (\mathbf{w}_k - \mathbf{w}_{k-1})$$

- Avoid Overfitting (regularization, dropout, early stopping)
- 100's PhD thesis on how to optimize. Always backpropagation.

N-ary Classification

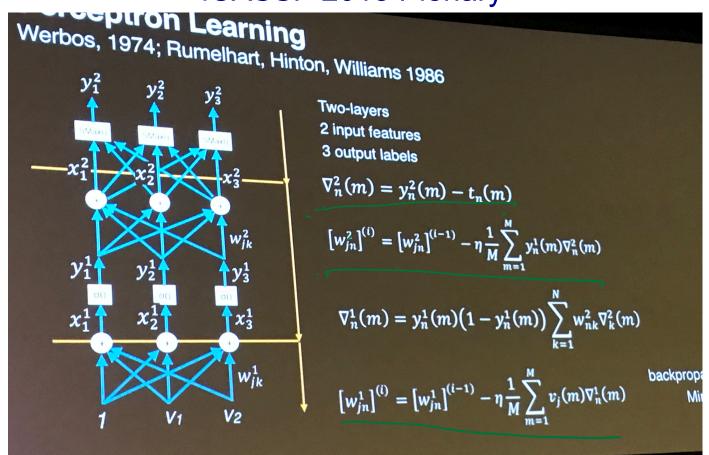

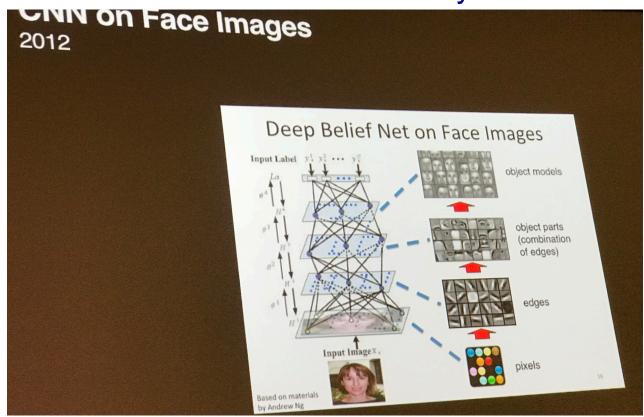

$$y_i = p(i|\mathbf{v}) = \frac{e^{x_i}}{\sum_{l=1}^{N} e^{x_l}}$$

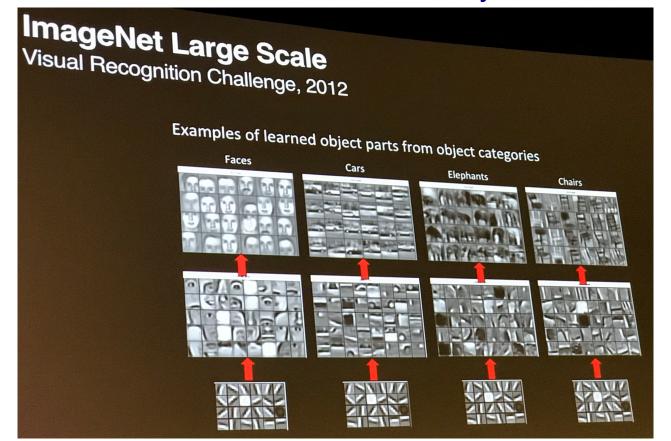

Softmax

$$L = \sum_{i=1}^{N} t_i \ln y_i$$

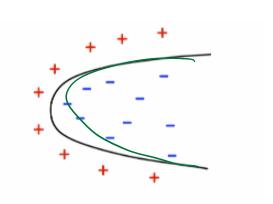

$$w_{nj}^{(i)} = w_{nj}^{(i-1)} + \eta v_n^{(i-1)} \left(t_j - y_j^{(i-1)} \right)$$

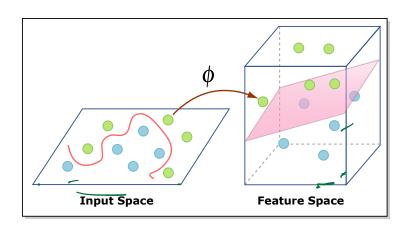

Lecture 9: Kernels

 $W^T q(x) = 0$

Basis expansion Kernel trick

Basis expansion

LSQ for classification

Each class C_k is described by its own linear model so that

$$y_k(\mathbf{x}) = \mathbf{w}_k^{\mathrm{T}} \mathbf{x} + w_{k0} \tag{4.13}$$

where k = 1, ..., K. We can conveniently group these together using vector notation so that

$$\mathbf{y}(\mathbf{x}) = \widetilde{\mathbf{W}}^{\mathrm{T}} \widetilde{\mathbf{x}} \tag{4.14}$$

Consider a training set $\{x_n, t_n\}$, n = 1 ...NDefine **X** and **T**

LSQ solution:

$$\widetilde{\mathbf{W}} = (\widetilde{\mathbf{X}}^{\mathrm{T}}\widetilde{\mathbf{X}})^{-1}\widetilde{\mathbf{X}}^{\mathrm{T}}\mathbf{T} = \widetilde{\mathbf{X}}^{\dagger}\mathbf{T}$$
(4.16)

And prediction

$$\underline{\mathbf{y}(\mathbf{x})} = \widetilde{\mathbf{W}}^{\mathrm{T}} \widetilde{\mathbf{x}} = \underline{\mathbf{T}^{\mathrm{T}} \left(\widetilde{\mathbf{X}}^{\dagger} \right)^{\mathrm{T}}} \widetilde{\mathbf{x}}. \tag{4.17}$$

Dual representation, Sec 6.2

Primal problem:
$$\min_{\mathbf{w}} E(\mathbf{w})$$
 $\times = \begin{bmatrix} -\frac{\lambda^{T}}{2} \end{bmatrix} \in \mathbb{R}^{N \times M}$ $E = \frac{1}{2} \sum_{n=1}^{N} \{ \mathbf{w}^{T} \mathbf{x}_{n} - t_{n} \}^{2} + \frac{\lambda}{2} ||\mathbf{w}||^{2} = ||\mathbf{X}\mathbf{w} - \mathbf{t}||_{2}^{2} + \frac{\lambda}{2} ||\mathbf{w}||^{2}$

Solution
$$\underline{w} = \underline{X}^+ \underline{t} = (\underline{X}^T \underline{X} + \lambda \underline{I}_{\underline{M}})^{-1} \underline{X}^T \underline{t}$$
 $\underline{w} \in \mathcal{R}^{\underline{M}}$

$$= \underline{X}^T (\underline{X} \underline{X}^T + \lambda \underline{I}_{\underline{N}})^{-1} \underline{t} = \underline{X}^T (\underline{K} + \lambda \underline{I}_{\underline{N}})^{-1} \underline{t} = \underline{X}^T \underline{a} \qquad a \in \mathcal{R}^{\underline{M}}$$

The kernel is
$$K = XX^T \in \mathbb{R}^{N \times N}$$

$$k_{ij} = \varphi(x_i) \varphi(x_2)$$

Dual representation is :
$$\min_{\boldsymbol{a}} E(\boldsymbol{a})$$

$$E = \frac{1}{2} \sum_{n=1}^{N} \{ \boldsymbol{w}^{T} \boldsymbol{x}_{n} - t_{n} \}^{2} + \frac{\lambda}{2} \| \boldsymbol{w} \|^{2} = \| \boldsymbol{K} \boldsymbol{a} - \boldsymbol{t} \|_{2}^{2} + \frac{\lambda}{2} \boldsymbol{a}^{T} \boldsymbol{K} \boldsymbol{a}$$

 $y = \mathbf{w}^T \mathbf{x} = \mathbf{a}^T \mathbf{X} \mathbf{x} = \sum_{n=1}^{N} a_n \mathbf{x}_n^T \mathbf{x} = \sum_{n=1}^{N} a_n k(\mathbf{x}_n, \mathbf{x})$

Prediction

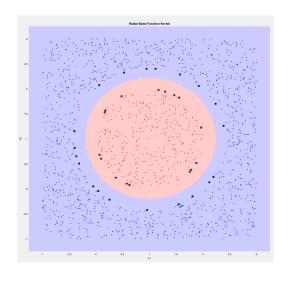

Dual representation, Sec 6.2

Prediction

$$y = \mathbf{w}^T \mathbf{x} = \mathbf{a}^T \mathbf{X} \mathbf{x} = \sum_{n=1}^{N} a_n \mathbf{x}_n^T \mathbf{x} = \sum_{n=1}^{N} a_n k(\mathbf{x}_n, \mathbf{x})$$

- Often a is sparse (... Support vector machines)
- We don't need to know **x** or $\varphi(x)$. *Just the Kernel*

$$E(\boldsymbol{a}) = \|\boldsymbol{K}\boldsymbol{a} - \boldsymbol{t}\|_{2}^{2} + \frac{\lambda}{2}\boldsymbol{a}^{T}\boldsymbol{K}\boldsymbol{a}$$

Gaussian Kernels

Gaussian Kernel

$$k(x,x') = \exp\left(-\frac{1}{2}(x-x')^T \Sigma^{-1}(x-x')\right)$$

Diagonal Σ : (this gives ARD)

$$k(x,x') = \exp\left(-\frac{1}{2}\sum_{i}^{N} \frac{\left(x_{i} - x_{i}'\right)^{2}}{\sigma_{i}^{2}}\right)$$

Isotropic σ_i^2 gives an RBF

$$k(x, x') = \exp\left(-\frac{\|x - x'\|_2^2}{2\sigma^2}\right) = \varphi(x)\varphi(x')$$
